

5-Gallon Container Instructions

You have received our DOT-approved, 5-gallon container filled with one of our Firefly Fuels. Now, how do you use a 5 gallon container most efficiently?

- First thing you need to do is install the spigot. To do this, you will need to remove a small piece of plastic.
- Position the container with the cap up. You will notice a threaded area in the center with a flat section at the bottom.

- The easiest next step is take a flat-blade screwdriver and hammer and punch out the center flat section. You may need to strike the area several times around the edge. You can simply let the punched-out section drop into the container.

- Thread the spigot onto the cap and tighten firmly to prevent any leakage.
- Make certain the valve is closed. The closed position is left or right. The open position is straight on.
- Position the 5-gallon container with the cap at the low position at the edge of a shelf with the spigot facing downward.
- Check for any leakage; correct if necessary.

Now, simply fill directly from the 5-gallon container into your vessel. Alternatively you can fill another container like a Pyrex measuring cup with a spout that can be used to refill any suitable tiki torch, oil candle, lamp or Lantern.
